Summary

HIPPA

The Health Insurance Portability and Accountability Act of 1996 (HIPAA) is a federal law that required the creation of national standards to protect sensitive patient health information from being disclosed without the patient's consent or knowledge.

How to Make a Patient List

- **How to make your Patient List:**

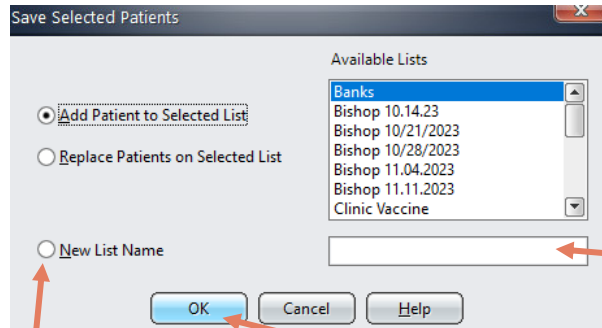

1. Click and highlight your patient's name

Highlight your Patient by clicking once

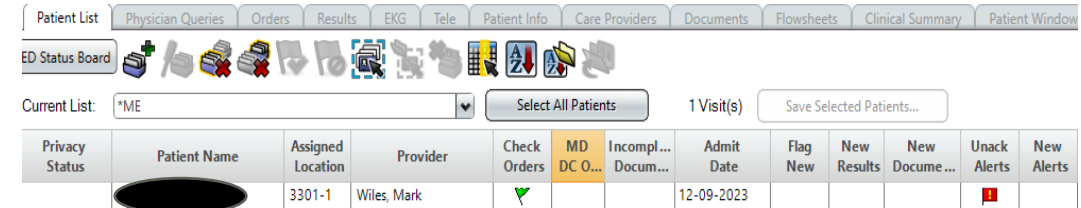

2. Click once

3. Click New list Name

4. Name your list

Click OK

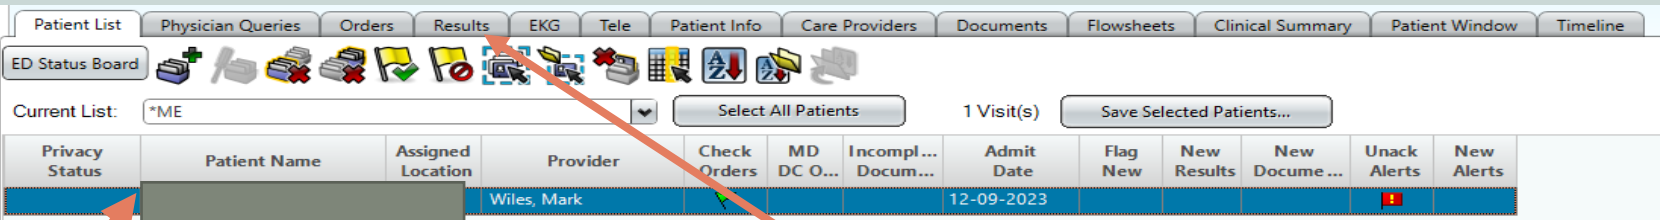

5. Final Step your patient is on your list
Every time you Login this is what you will see

Do this each clinical day except
Click replace Patients on selected list
To change your patient

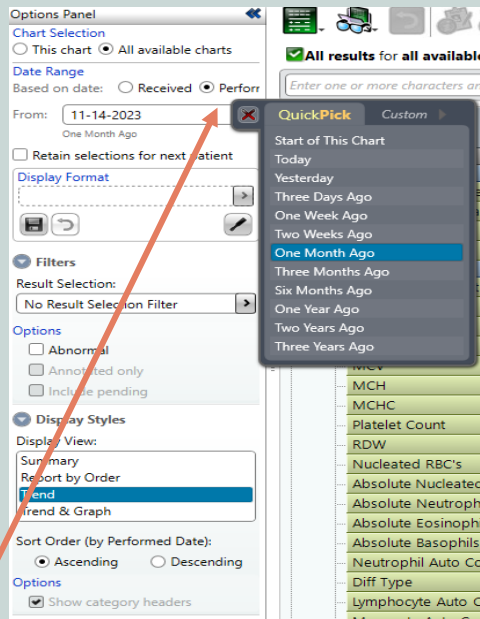

Patient Test Results

1. Highlight your patient with one click

2. Click Results

☐ Carvedilol
Show less
Carvedilol is used alone or in combination with other medications to treat heart failure (condition in which the heart cannot pump enough blood to all parts of the body) and high blood pressure. It also is used to improve survival after a heart attack. Carvedilol is often used in combination with other medications. Carvedilol is in a class of medications called beta-blockers. It works by relaxing blood vessels and slowing heart rate to improve blood flow and decrease blood pressure High blood pressure is a common condition and when not treated, can cause damage to the brain, heart, blood vessels, kidneys and other parts of the body. Damage to these organs may cause heart disease, a heart attack, heart failure, stroke, kidney failure, loss of vision, and other problems. In addition to taking medication, making lifestyle changes will also help to control your blood pressure. These changes include eating a diet that is low in fat and salt, maintaining a healthy weight, exercising at least 30 minutes most days, not smoking, and using alcohol in moderation.
